where and denote the occupation of the *m* sublevel of spin , and the occupation of the host material without doping. The parameter can be tuned to fulfil the linearity of E(N), i.e., the generalized Koopmans condition:

$$h_{Rk} = E(N-1) - E(N) + eig(N) = 0,$$
 (2)

where E(N-1) - E(N) denotes the total energy cost to rem
